

Instructions for Use

Sapropterin Dihydrochloride Powder for Oral Solution (SAP-roë-TER-in dye-HYE-droe-KLOR-ide)

Read this Instructions for Use before you start taking sapropterin dihydrochloride powder for oral solution and each time you refill your prescription. There may be new information. This information does not take the place of talking with your healthcare provider about your treatment. Talk to your doctor if you have any questions about the right dose of sapropterin dihydrochloride powder for oral solution to take or how to mix it.

Important information:

- Sapropterin dihydrochloride powder for oral solution comes in a packet containing powder.
- Take sapropterin dihydrochloride powder for oral solution exactly as your doctor tells you. Your doctor should tell you how much sapropterin dihydrochloride powder for oral solution to take and when to take it.
- Your doctor may change your dose of sapropterin dihydrochloride powder for oral solution depending on how you respond to treatment, or based on your baby's weight.
- If your baby weighs 22 pounds or less, follow the section called "Instructions for giving sapropterin dihydrochloride powder for oral solution (sapropterin dihydrochloride 100 mg packets) to babies who weigh 22 pounds or less".
- Take sapropterin dihydrochloride powder for oral solution 1 time each day with a meal. It is best to take sapropterin dihydrochloride powder for oral solution at the same time each day.

Instructions for taking sapropterin dihydrochloride powder for oral solution:

For babies who weigh 22 pounds or less, see the section below called "Instructions for giving sapropterin dihydrochloride powder for oral solution (sapropterin dihydrochloride 100 mg packets) to babies who weigh 22 pounds or less."

Sapropterin dihydrochloride powder for oral solution should be dissolved in water or apple juice. The powder for oral solution may also be mixed in a small amount of soft foods, such as apple sauce or pudding.

To dissolve sapropterin dihydrochloride powder for oral solution:

- Be sure that you know what dose of sapropterin dihydrochloride powder for oral solution your doctor has prescribed and whether you should use sapropterin dihydrochloride 100 mg packets, sapropterin dihydrochloride 500 mg packets, or both types of packets to prepare your dose.
- Open the packet(s) of sapropterin dihydrochloride powder for oral solution by folding and tearing, or cutting at the dotted line in the upper right corner of the packet. Open the packet(s) only when you are ready to use them.
- Empty the contents of the packet(s) into 4 ounces to 8 ounces (1/2 cup to 1 cup) of water or apple juice.
- Drink within 30 minutes.

Instructions for giving sapropterin dihydrochloride powder for oral solution (sapropterin dihydrochloride 100 mg packets) to babies who weigh 22 pounds or less:

- The dose of sapropterin dihydrochloride powder for oral solution is based on body weight. This will change as your baby grows. Your doctor will tell you:
 - the number of sapropterin dihydrochloride 100 mg packets needed for one dose
 - the amount of water or apple juice needed to mix one dose of sapropterin dihydrochloride powder for oral solution
 - the amount of the mixture (powder and water or apple juice) you will need to give your baby his or her prescribed dose of medicine.
- Give your baby the prescribed amount of mixture (powder and water or apple juice) within 30 minutes after mixing. If you are not able to give your baby's dose within 30 minutes after mixing, pour the unused medicine into the trash. You will need to mix a new dose.

Supplies needed to mix and give your baby's dose of sapropterin dihydrochloride powder for oral solution:

- the number of sapropterin dihydrochloride 100 mg packets needed for one dose
- a small cup of water or apple juice
- one 30 mL medicine cup for mixing
- small spoon or clean utensil for mixing
- 10 mL oral dosing syringe
- scissors (optional)

Ask your pharmacist for a 30 mL medicine cup for mixing and an oral dosing syringe if you do not have these supplies.

Step 1: Find a clean, flat work surface.

Step 2: Place a small cup of water or apple juice, the oral dosing syringe, and an empty medicine cup on your clean, flat work surface (see Figure A).

Step 3: Pour 5 mL or 10 mL of water or apple juice from the small cup into the medicine cup, as instructed by your doctor. Check to make sure that the amount of liquid lines up with the amount that your doctor tells you (see Figure B).

Step 4: Check the label on the sapropterin dihydrochloride powder for oral solution packet(s). If the packet is marked sapropterin dihydrochloride powder for oral solution 100 mg, empty the entire contents of the sapropterin dihydrochloride powder for oral solution packet into the medicine cup (see Figure C).

Step 5: Stir the mixture with the small spoon or other clean utensil until all of the powder completely dissolves (see Figure D).

Step 6: To give a dose of sapropterin dihydrochloride powder for oral solution to your baby: Place the tip of the oral dosing syringe into the liquid inside the medicine cup. Pull back on the plunger and draw up the amount of the mixture prescribed by your doctor (see Figure E).

Step 7: Take the oral dosing syringe out of the medicine cup. Carefully turn the oral dosing syringe so that the tip is pointing up. Check to make sure that the amount of medicine in the oral dosing syringe lines up with the amount of mixture prescribed by your doctor (see Figure F).

Step 8: Place the tip of the oral dosing syringe into your baby's mouth. Point the tip of the oral dosing syringe toward either cheek (see Figure G).

Push on the plunger slowly, a small amount at a time, until all of the mixture in the oral dosing syringe is given.

Step 9: Throw away any remaining mixture. Remove the plunger from the barrel of the oral dosing syringe. Wash the oral dosing syringe and medicine cup with warm water and air dry. When the oral dosing syringe is dry, put the plunger back into the barrel. Store the oral dosing syringe and medicine cup for the next use.

How should I store sapropterin dihydrochloride powder for oral solution?

- Store sapropterin dihydrochloride powder for oral solution at room temperature between 68°F to 77°F (20°C to 25°C).
- Protect from moisture.

Keep sapropterin dihydrochloride powder for oral solution and all medicines out of the reach of children.

Uncontrolled blood phenylalanine concentrations before and during pregnancy are associated with an increased risk of adverse pregnancy outcomes and fetal adverse effects. To reduce the risk of hyperphenylalaninemia-induced fetal adverse effects, blood phenylalanine concentrations should be maintained between 120 and 360 micromol/L during pregnancy and during the 3 months before conception (see Dosage and Administration (2.2)).

Data

Human Data

Uncontrolled Maternal PKU

Available data from the Maternal Phenylketonuria Collaborative Study on 488 pregnancies and 331 live births in PKU-affected women demonstrated that uncontrolled blood levels above 400 micromol/L are associated with a very high incidence of neurological, cardiac, facial dysmorphism, and growth anomalies. Control of blood phenylalanine during pregnancy is essential to reduce the incidence of Phe-induced teratogenic effects.

Animal Data
No effects on embryo-fetal development were observed in a reproduction study in rats using oral doses of up to 400 mg/kg per day sapropterin dihydrochloride (about 3 times the MHRD of 20 mg/kg per day, based on body surface area) administered during the period of organogenesis. However, in a rabbit reproduction study, oral administration of a maximum dose of 600 mg/kg per day (about 10 times the MHRD, based on body surface area) during the period of organogenesis was associated with a non-statistically significant increase in the incidence of holoprosencephaly in two high-dose treated litters (4 fetuses), compared to one control-treated litter (1 fetus).

8.2 Lactation

Risk Summary

There are insufficient data to assess the presence of sapropterin in human milk and no data on the effects on milk production. In postmarketing pregnancy registries, 13 infants were exposed to sapropterin dihydrochloride through breastfeeding. No lactation-related safety concerns were reported in infants of mothers nursing during maternal treatment with sapropterin dihydrochloride. There are no data on the effects on milk production. Sapropterin is present in the milk of lactating rats following intravenous administration, but not following oral administration.

The developmental and health benefits of breastfeeding should be considered along with the mother's clinical need for sapropterin dihydrochloride and any potential adverse effects on the breastfed child from sapropterin dihydrochloride or from the underlying maternal condition.

8.4 Pediatric Use

Pediatric patients with PKU, ages 1 month to 16 years, have been treated with sapropterin dihydrochloride in clinical trials (see Clinical Studies (14)).

The efficacy and safety of sapropterin dihydrochloride have not been established in neonates. The safety of sapropterin dihydrochloride has been established in children younger than 4 years in trials of 8 months duration and in children 4 years and older in trials of up to 3 years in length (see Adverse Reactions (6.1)).

In children aged 1 month and older, the efficacy of sapropterin dihydrochloride has been demonstrated in trials of 2 weeks or less in duration (see Clinical Studies (14)).

In a multicenter, open-label, single-arm study, 57 patients aged 1 month to 6 years who were defined as sapropterin dihydrochloride responders after 4 weeks of sapropterin dihydrochloride treatment and Phe dietary restriction were treated for 6 months with sapropterin dihydrochloride at 20 mg/kg per day. The effectiveness of sapropterin dihydrochloride alone on reduction of blood Phe levels beyond 4 weeks could not be determined due to concurrent changes in dietary Phe intake during the study. Mean (\pm SD) blood Phe values over time for patients aged 1 month to < 2 years and 2 to < 7 years are shown in Figure 1.

Figure 1: Mean Blood Phe Level Over Time by Age (years) (N = 57)

8.5 Geriatric Use

Clinical studies of sapropterin dihydrochloride in patients with PKU did not include patients aged 65 years and older. It is not known whether these patients respond differently than younger patients.

10 OVERDOSSAGE

Two uncontrolled overdosage with sapropterin dihydrochloride have been reported. One adult patient in a sapropterin dihydrochloride clinical trial received a single sapropterin dihydrochloride dose of 4,500 mg (36 mg/kg instead of 2,600 mg (20 mg/kg)). The patient reported mild headache and mild dizziness beginning after the dose, both symptoms resolved within 1 hour with no treatment intervention. There were no associated laboratory test abnormalities. The patient suspended therapy for 24 hours and then restarted sapropterin dihydrochloride with no reports of abnormal signs or symptoms. In postmarketing, a pediatric patient received sapropterin dihydrochloride doses of 45 mg/kg per day instead of 20 mg/kg per day. The patient reported hyperactivity that began at an unspecified time after overdosage and resolved after the sapropterin dihydrochloride dose was reduced to 20 mg/kg per day.

In a clinical study to evaluate the effects of sapropterin dihydrochloride on cardiac regularization, a single supra-therapeutic dose of 100 mg/kg (5 times the maximum recommended dose) was administered to 54 healthy adults. No serious adverse reactions were reported during the study. The only adverse reactions reported in more than 1 subject who received the supra-therapeutic dose were upper abdominal pain (5%) and dizziness (4%). A dose-dependent shortening of the QT interval was observed (see Clinical Pharmacology (12.2)).

Patients should be advised to notify their physicians in cases of overdosage.

11 DESCRIPTION

Sapropterin dihydrochloride is an orally administered Phenylalanine Hydroxylase activator for PAH activator. Sapropterin dihydrochloride, the active pharmaceutical ingredient, is sapropterin dihydrochloride powder for oral solution, a synthetic preparation of the dihydrochloride salt of naturally occurring tetrahydrobiopterin (BH4). Sapropterin dihydrochloride is a white to pale yellow color powder.

The chemical name of sapropterin dihydrochloride is (6R)-2-amino-6,7,8,11,12-tetrahydro-4H-pteridine-4,7-dithiolate-5,6,7,8-tetrahydro-4,11b-pteridine dihydrochloride and the molecular formula is C₁₂H₁₄N₄S₂Cl₂ with a molecular weight of 314.17. Sapropterin dihydrochloride has the following structural formula:

Sapropterin dihydrochloride is supplied as powder for oral solution containing 100 mg of sapropterin dihydrochloride (equivalent to 76.8 mg of sapropterin base). Sapropterin dihydrochloride is also supplied as powder for oral solution containing 500 mg of sapropterin dihydrochloride (equivalent to 384 mg of sapropterin base).

Sapropterin dihydrochloride powder for oral solution is off white to yellow in color. Each unit dose packet contains the following inactive ingredients: ascorbic acid, mannitol, potassium citrate monohydrate and sucralose.

12.1 CLINICAL PHARMACOLOGY

12.1.1 Mechanism of Action

Sapropterin dihydrochloride is a synthetic form of BH4, the cofactor for the enzyme phenylalanine hydroxylase (PAH). PAH hydroxylates Phe through an oxidative reaction to form tyrosine. In patients with PKU, PAH activity is absent or deficient. Treatment with BH4 can activate residual PAH enzyme activity, improve the normal oxidative metabolism of Phe, and decrease Phe levels in some patients.

12.2 Pharmacodynamics

In PKU patients who are responsive to BH4 treatment, blood Phe levels decrease within 24 hours after a single oral administration of sapropterin dihydrochloride. In patients with PKU, sapropterin dihydrochloride is administered as a single therapeutic dose (20 mg/kg) of sapropterin dihydrochloride had an effect on cardiac regularization. In this study, sapropterin dihydrochloride was administered after dissolving tablets in water under fed condition. This study demonstrated a dose-dependent shortening of the QT interval. The maximum placebo-subtracted mean change from baseline of the QTc interval was: -3.69 and -8.32 ms (lower bound of 90% CI: -5.3 ms and -10.6 ms at 20 and 100 mg/kg, respectively).

Cardiac Electrophysiology

A thorough QTc study was performed in 56 healthy adults. This randomized, placebo and active controlled crossover study was conducted to determine if a single supra-therapeutic (100 mg/kg) dose of sapropterin dihydrochloride or a single therapeutic dose (20 mg/kg) of sapropterin dihydrochloride had an effect on cardiac regularization. In this study, sapropterin dihydrochloride was administered after dissolving tablets in water under fed condition. This study demonstrated a dose-dependent shortening of the QT interval. The maximum placebo-subtracted mean change from baseline of the QTc interval was: -3.69 and -8.32 ms (lower bound of 90% CI: -5.3 ms and -10.6 ms at 20 and 100 mg/kg, respectively).

12.3 Pharmacokinetics

Studies in healthy subjects have shown comparable absorption of sapropterin when tablets are dissolved in water or orange juice and taken under fasted conditions. Administration of dissolved tablets after a high-fat-calorie meal resulted in mean increases in C_{max} of 84% and AUC of 87% (dissolved in water). However, there was extensive variability in individual subject values for C_{max} and AUC across the different modes of administration and meal conditions. In the clinical trials of sapropterin dihydrochloride, drug was administered in the morning as a dissolved tablet without regard to meals. The mean elimination half-life in PKU patients was approximately 5.7 hours (range 3.8 to 17 hours), comparable with values seen in healthy subjects (range 3.0 to 5.3 hours).

A study in healthy adults with 10 mg/kg of sapropterin dihydrochloride demonstrated that the absorption via intact tablet administration was 40% greater than via dissolved tablet administration under fasted conditions based on AUC₀₋₁₂. The absorption of intact tablets under fed conditions resulted in an approximately 45% increase in the extent of absorption compared to fasted conditions based on AUC₀₋₁₂ (see Dosage and Administration (2.3)).

Population pharmacokinetic analysis of sapropterin including patients from 1 month to 48 years of age showed that body weight is the only covariate statistically affecting clearance or distribution volume (see Table S). Pharmacokinetics in patients > 45 years of age have not been studied.

Table S: Apparent Plasma Clearance by Age

Parameter	0 to < 1 yr (N=10)	1 to < 6 yr (N=57)	6 to < 12 yr (N=23)	12 to < 18 yr (N=24)	≥ 18 yr (N=42)
CL _{IF} (L/hr/kg) Mean \pm SD (Median)	81.5 \pm 62.4 (53.6)	50.7 \pm 20.1 (48.4)	51.7 \pm 21.9 (47.4)	38.2 \pm 9.3 (38.3)	37.9 \pm 20.2 (31.8)

*Evaluated at 20 mg/kg per day dose.
†Evaluated at 5, 10, or 20 mg/kg per day doses.

Metabolism

Sapropterin is a synthetic form of tetrahydrobiopterin (BH4) and is expected to be metabolized and recycled by the same endogenous enzymes. *In vivo* endogenous BH4 is converted to quinoid dihydrobiopterin and is metabolized to dihydrobiopterin and bipterin. The enzymes dihydrobiopterin reductase and dihydropteridine reductase are responsible for the metabolism and recycling of BH4.

Drug Interaction Studies

Clinical Studies

In healthy subjects, administration of a single dose of sapropterin dihydrochloride at the maximum therapeutic dose of 20 mg/kg had no effect on the pharmacokinetics of a single dose of digoxin IP ap substrate administered concomitantly.

In Vitro Studies Where Drug Interaction Potential Was Not Further Evaluated Clinically

The potential for sapropterin to induce or inhibit cytochrome P450 enzymes was evaluated in *in vitro* studies which showed sapropterin did not inhibit CYP 1A2, 2B6, 2C8, 2C9, 2C19, 2D6, or 3A4/5, nor induce CYP 1A2, 2B6, or 3A4/5.

In vitro sapropterin did not inhibit DAT1, DAT3, OCT2, MATE1, and MATE2-K transporters. The potential for sapropterin to inhibit OATP1B1 and OATP1B3 has not been adequately studied. *In vitro*, sapropterin inhibits breast cancer resistance protein (BCRP) but the potential for a clinically significant increase in systemic exposure of BCRP substrates by sapropterin dihydrochloride appears to be low.

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

A 2-year carcinogenicity study was conducted in F344 rats, and a 78-week carcinogenicity study was conducted in CD-1 mice. In the 104-week oral carcinogenicity study in rats, sapropterin dihydrochloride doses of 25, 80, and 250 mg/kg per day (0.2, 0.7, and 2 times the maximum recommended human dose of 20 mg/kg per day, respectively, based on body surface area) were used. In the 78-week oral carcinogenicity study in mice, sapropterin dihydrochloride doses of 25, 80, and 250 mg/kg per day (0.1, 0.3, and 2 times the recommended human dose, respectively, based on body surface area) were used. In the 2-year rat carcinogenicity study, there was a statistically significant increase in the incidence of benign adrenal pheochromocytoma in male rats treated with the 250 mg/kg per day (about 2 times the maximum recommended human dose, based on body surface area) compared to vehicle treated rats. The mouse carcinogenicity study showed no evidence of a carcinogenic effect, but the study was not ideal due to its duration of 78 instead of 104 weeks.

Sapropterin dihydrochloride was genotoxic in the *in vitro* Ames test at concentrations of 625 mcg (TA98) and 5000 mcg (TA100) per plate, without metabolic activation. However, no genotoxicity was observed in the *in vitro* Ames test with metabolic activation. Sapropterin dihydrochloride was genotoxic in the *in vitro* chromosomal aberration assay in Chinese hamster lung cells at concentrations of 0.25 and 0.5 mM. Sapropterin dihydrochloride was not mutagenic in the *in vivo* micronucleus assay in mice at doses up to 2000 mg/kg per day (about 6 times the maximum recommended human dose of 20 mg/kg per day, based on body surface area). Sapropterin dihydrochloride, at oral doses up to 400 mg/kg per day (about 2 times the maximum recommended human dose, based on body surface area) was found to have no effect on fertility and reproductive function of male and female rats.

14 CLINICAL STUDIES

The efficacy of sapropterin dihydrochloride was evaluated in five clinical studies in patients with PKU.

Study 1 was a multicenter, open-label, uncontrolled clinical trial of 489 patients with PKU, ages 8 to 48 years (mean 22 years), who had baseline blood Phe levels \geq 450 μ mol/L and who were not on Phe-restricted diets. All patients received treatment with sapropterin dihydrochloride 10 mg/kg per day for 8 days. For the purpose of this study, response to sapropterin dihydrochloride treatment was defined as a \geq 30% decrease in blood Phe from baseline. At Day 8, 50 patients (10%) were identified as responders.

Study 2 was a multicenter, double-blind, placebo-controlled study of 88 patients with PKU who responded to sapropterin dihydrochloride in Study 1. After a washout period from Study 1, patients were randomized equally to either sapropterin dihydrochloride 10 mg/kg per day (N=41) or placebo (N=47) for 8 weeks. Efficacy was assessed by the mean change in blood Phe level from baseline to Week 6 in the sapropterin dihydrochloride-treated group as compared to the mean change in the placebo group.

The results showed that at baseline, the mean (\pm SD) blood Phe level was 843 (\pm 300) μ mol/L in the sapropterin dihydrochloride-treated group and 888 (\pm 323) μ mol/L in the placebo group. At Week 6, the sapropterin dihydrochloride-treated group had a mean (\pm SD) blood Phe level of 607 (\pm 377) μ mol/L, and the placebo group had a mean blood Phe level of 891 (\pm 348) μ mol/L. At Week 6, the sapropterin dihydrochloride and placebo-treated groups had mean changes in blood Phe level of -238 and 6 μ mol/L, respectively (mean percent changes of -29% (\pm 32) and 2% (\pm 53), respectively). The difference between the groups was statistically significant (p < 0.001) (Table 6).

Table 6: Blood Phe Results in Study 2

	Sapropterin (N=41)	Placebo (N=47)
Baseline Blood Phe Level (μ mol/L)		
Mean (\pm SD)	843 (\pm 300)	888 (\pm 323)
Percentiles (25 th , 75 th)	620, 980	618, 1141
Week 6 Blood Phe Level (μ mol/L)		
Mean (\pm SD)	607 (\pm 377)	891 (\pm 348)
Percentiles (25 th , 75 th)	307, 812	618, 1143
Mean Change in Blood Phe From Baseline to Week 6 (μ mol/L)		
Adjusted Mean (\pm SE)	-238 (\pm 38)	6 (\pm 36)
Percentiles (25 th , 75 th)	-387, 82	-95, 92
Mean Percent Change in Blood Phe From Baseline to Week 6		
Mean (\pm SD)	-28 (\pm 32)	3 (\pm 33)
Percentiles (25 th , 75 th)	-61, -11	-13, 12

*The mean baseline levels shown in this table represent the mean of 3 pretreatment levels (Wk -2, Wk -1, and Wk 0). Treatment with sapropterin dihydrochloride or placebo started at Wk 0.
†p-value < 0.001, adjusted mean and standard error from an ANCOVA model with change in blood Phe level from baseline to Week 6 as the response variable, and both treatment group and baseline blood Phe level as covariates.

Change in blood Phe was noted in the sapropterin dihydrochloride-treated group at Week 1 and was sustained through Week 6 (Figure 2).

Figure 2: Mean Blood Phenylalanine (Phe) Level Over Time*

*Error bars indicate 95% confidence interval.
Study 3 was a multicenter, open-label, extension study in which 80 patients who responded to sapropterin dihydrochloride treatment in Study 1 and completed Study 2 underwent 6 weeks of forced dose titration with 3 different doses of sapropterin dihydrochloride. Treatments consisted of 3 consecutive 2-week courses of sapropterin dihydrochloride at doses of 5, then 20, and then 10 mg/kg per day. Blood Phe level was monitored after 2 weeks of treatment at each dose level. At baseline, mean (\pm SD) blood Phe was 844 (\pm 398) μ mol/L. At the end of treatment with 5, 10, and 20 mg/kg per day, mean (\pm SD) blood Phe levels were 744 (\pm 384) μ mol/L, 640 (\pm 382) μ mol/L, and 581 (\pm 389) μ mol/L, respectively (Table 7).

Table 7: Blood Phe Results From Forced Dose Titration in Study 3

Sapropterin Dihydrochloride Dose Level (mg/kg per day)	No. of Patients	Mean (\pm SD) Blood Phe Level (μ mol/L)	Mean Changes (\pm SD) in Blood Phe Level From Week 0 (μ mol/L)
Baseline (No Treatment)	80	844 (\pm 398)	—
5	80	744 (\pm 384)	-100 (\pm 295)
10	80	640 (\pm 382)	-204 (\pm 303)
20	80	581 (\pm 389)	-263 (\pm 318)

Study 4 was a multicenter study of 80 pediatric patients with PKU, ages 4 to 12 years, who were on Phe-restricted diets and who had blood Phe levels \leq 450 μ mol/L at screening. All patients were treated with open-label sapropterin dihydrochloride 20 mg/kg per day for 8 days. Response to sapropterin dihydrochloride was defined as a \geq 30% decrease in blood Phe from baseline at Day 8. At Day 8, 50 patients (65%) had a \geq 30% decrease in blood Phe.

Study 5 was an open-label, single-arm, multicenter trial in 93 pediatric patients with PKU, aged 1 month to 6 years, who had Phe levels greater than or equal to 380 μ mol/L at screening. All patients were treated with sapropterin dihydrochloride at 20 mg/kg per day and maintained on a Phe-restricted diet. At Week 4, 57 patients (61%) were identified as responders (defined as a
