

HIGHLIGHTS OF PRESCRIBING INFORMATION
These highlights do not include all the information needed to use METFORMIN HYDROCHLORIDE ORAL SOLUTION safely and effectively. See full prescribing information for METFORMIN HYDROCHLORIDE ORAL SOLUTION.
METFORMIN HYDROCHLORIDE oral solution
Initial U.S. Approval: 1995

WARNING: LACTIC ACIDOSIS
See full prescribing information for complete boxed warning

- Postmarketing cases of metformin-associated lactic acidosis have resulted in death, hypothermia, hypotension, and resistant bradyarrhythmias. Symptoms included malaise, myalgias, respiratory distress, somnolence, and abdominal pain. Laboratory abnormalities included elevated blood lactate levels, anion gap acidosis, increased lactate/pyruvate ratio, and metformin plasma levels generally > 5 mcg/mL (5.1)
- Risk factors include renal impairment, concomitant use of certain drugs, age ≥ 65 years old, radiological studies with contrast, surgery and other procedures, hypoxic states, excessive alcohol intake, and hepatic impairment. Steps to reduce the risk of and manage metformin-associated lactic acidosis in these high risk groups are provided in the Full Prescribing Information. (5.1)
- If lactic acidosis is suspected, discontinue metformin hydrochloride oral solution and institute general supportive measures in a hospital setting. Prompt hemodialysis is recommended. (5.1)

INDICATIONS AND USAGE
Metformin hydrochloride is a biguanide indicated as an adjunct to diet and exercise to improve glycemic control in adults and pediatric patients 10 years of age and older with type 2 diabetes mellitus. (1)

- DOSAGE AND ADMINISTRATION**
Adult Dosage for Metformin Hydrochloride Oral Solution:
- Starting dose: 500 mg (5 mL) orally twice a day or 850 mg (8.5 mL) once a day, with meals (2.1)
 - Increase the dose in increments of 500 mg (5 mL) weekly or 850 mg (8.5 mL) every 2 weeks, up to a maximum dose of 2,550 mg (25.5 mL) per day, given in divided doses (2.1)
 - Doses above 2,000 mg (20 mL) may be better tolerated given in divided doses 3 times a day with meals (2.1)
- Pediatric Dosage for Metformin Hydrochloride Oral Solution:*
- Starting dose: 500 mg (5 mL) orally twice a day, with meals (2.2)
 - Increase dosage in increments of 500 mg (5 mL) weekly up to a maximum of 2,000 mg (20 mL) per day, given in divided doses twice daily (2.2)
- Renal Impairment:**
- Prior to initiation, assess renal function with estimated glomerular filtration rate (eGFR) (2.3)
 - Do not use in patients with eGFR below 30 mL/minute/1.73 m² (2.3)
 - Initiation is not recommended in patients with eGFR between 30 to 45 mL/minute/1.73 m² (2.3)
 - Assess risk/benefit of continuing metformin hydrochloride oral solution if eGFR falls below 45 mL/minute/1.73 m² (2.3)
 - Discontinue if eGFR falls below 30 mL/minute/1.73 m² (2.3)

WARNING: LACTIC ACIDOSIS

Postmarketing cases of metformin-associated lactic acidosis have resulted in death, hypothermia, hypotension, and resistant bradyarrhythmias. The onset of metformin-associated lactic acidosis is often subtle, accompanied only by nonspecific symptoms such as malaise, myalgias, respiratory distress, somnolence, and abdominal pain. Metformin-associated lactic acidosis was characterized by elevated blood lactate levels (> 5 mmol/Liter), anion gap acidosis (without evidence of ketonuria or ketonemia), an increased lactate/pyruvate ratio, and metformin plasma levels generally > 5 mcg/mL (see *Warnings and Precautions* (5.1)).

Risk factors for metformin-associated lactic acidosis include renal impairment, concomitant use of certain drugs (e.g. carbonic anhydrase inhibitors such as topiramate), age 65 years old or greater, having a radiological study with contrast, surgery and other procedures, hypoxic states (e.g., acute congestive heart failure), excessive alcohol intake, and hepatic impairment.

Steps to reduce the risk of and manage metformin-associated lactic acidosis in these high risk groups are provided (see *Dosage and Administration* (2.3), *Contraindications* (4), *Warnings and Precautions* (5.1)).

If metformin-associated lactic acidosis is suspected, immediately discontinue metformin hydrochloride oral solution and institute general supportive measures in a hospital setting. Prompt hemodialysis is recommended (see *Warnings and Precautions* (5.1)).

- 1 INDICATIONS AND USAGE**
Metformin hydrochloride oral solution is indicated as an adjunct to diet and exercise to improve glycemic control in adults and pediatric patients 10 years of age and older with type 2 diabetes mellitus.
- 2 DOSAGE AND ADMINISTRATION**
2.1 Adult Dosage
- Measure the metformin hydrochloride oral solution dose in the metformin hydrochloride oral solution specific dosing cup.
 - The recommended starting dose of metformin hydrochloride oral solution is 500 mg (5 mL) orally twice a day or 850 mg (8.5 mL) once a day, given with meals.
 - Increase the dose in increments of 500 mg (5 mL) weekly on the basis of glycemic control and tolerability, up to a maximum dose of 2,550 mg (25.5 mL) per day, given in divided doses.
 - Doses above 2,000 mg (20 mL) may be better tolerated given in divided doses 3 times a day with meals.
- 2.2 Pediatric Dosage**
- Measure the metformin hydrochloride oral solution dose in the metformin hydrochloride oral solution specific dosing cup.
 - The recommended starting dose of metformin hydrochloride oral solution for pediatric patients 10 years of age and older is 500 mg (5 mL) orally twice a day, given with meals.
 - Increase dosage in increments of 500 mg (5 mL) weekly on the basis of glycemic control and tolerability, up to a maximum of 2,000 mg (20 mL) per day, given in divided doses twice daily.
- 2.3 Recommendations for Use in Renal Impairment**
- Assess renal function prior to initiation of metformin hydrochloride oral solution and periodically thereafter.
 - Metformin hydrochloride oral solution is contraindicated in patients with an estimated glomerular filtration rate (eGFR) below 30 mL/minute/1.73 m².
 - Initiation of metformin hydrochloride oral solution in patients with an eGFR between 30 to 45 mL/minute/1.73 m² is not recommended.
 - In patients taking metformin hydrochloride oral solution whose eGFR later falls below 45 mL/minute/1.73 m², assess the benefit/risk of continuing therapy.
 - Discontinue metformin hydrochloride oral solution if the patient's eGFR later falls below 30 mL/minute/1.73 m² (see *Warnings and Precautions* (5.1)).
- 2.4 Discontinuation for Iodinated Contrast Imaging Procedures**
Discontinue metformin hydrochloride oral solution at the time of, or prior to, an iodinated contrast imaging procedure in patients with an eGFR between 30 and 60 mL/minute/1.73 m²; in patients with a history of liver disease, alcoholism, or heart failure; or in patients who will be administered intra-arterial iodinated contrast. Re-evaluate eGFR 48 hours after the imaging procedure; restart metformin hydrochloride oral solution if renal function is stable.

- Discontinuation for Iodinated Contrast Imaging Procedures:**
- Metformin hydrochloride oral solution may need to be discontinued at time of, or prior to, iodinated contrast imaging procedures (2.4)
- DOSAGE FORMS AND STRENGTHS**
Oral Solution: 500 mg per 5 mL (100 mg/mL) in cherry flavor (3)
- CONTRAINDICATIONS**
- Severe renal impairment (eGFR below 30 mL/minute/1.73 m²) (4, 5.1)
 - Hypersensitivity to metformin (4)
 - Acute or chronic metabolic acidosis, including diabetic ketoacidosis, with or without coma, (4)
- WARNINGS AND PRECAUTIONS**
- Lactic acidosis:* See boxed warning. (5.1)
 - Vitamin B₁₂ deficiency:* Metformin may lower vitamin B₁₂ levels. Measure hematologic parameters annually and vitamin B₁₂ at 2 to 3 year intervals and manage any abnormalities. (5.2)
 - Hypoglycemia with Concomitant Use with Insulin and Insulin Secretagogues:* Increased risk of hypoglycemia when used in combination with insulin and/or an insulin secretagogue. Lower dose of insulin or insulin secretagogue may be required (5.3)
- ADVERSE REACTIONS**
The most common adverse reactions are diarrhea, nausea/vomiting, flatulence, asthenia, indigestion, abdominal discomfort, and headache. (6.1)
- To report SUSPECTED ADVERSE REACTIONS, contact Amnora Pharma Private Limited at 1-866-495-1995 or FDA at 1-800-FDA-1088 or http://www.fda.gov/medwatch**
- DRUG INTERACTIONS**
- Carbonic anhydrase inhibitors may increase risk of lactic acidosis. Consider more frequent monitoring (7)
 - Drugs that reduce metformin clearance (such as ranolazine, vandetanib, dolutegravir, and cimetidine) may increase the accumulation of metformin. Consider the benefits and risks of concomitant use (7)
 - Alcohol can potentiate the effect of metformin on lactate metabolism. Warn patients against excessive alcohol intake (7)
- USE IN SPECIFIC POPULATIONS**
- Females and Males of Reproductive Potential: Advise premenopausal females of the potential for an unintended pregnancy. (8.3)
 - Geriatric Use: Assess renal function more frequently. (8.5)
 - Hepatic Impairment: Avoid use in patients with hepatic impairment. (8.7)

See 17 for PATIENT COUNSELING INFORMATION and FDA-approved patient labeling

Revised: 03/2025

17 PATIENT COUNSELING INFORMATION	
*Sections or subsections omitted from the full prescribing information are not listed.	

- 3 DOSAGE FORMS AND STRENGTHS**
Oral solution: 500 mg per 5 mL (100 mg/mL) clear, colorless solution having cherry flavor.
- 4 CONTRAINDICATIONS**
Metformin hydrochloride oral solution is contraindicated in patients with:
- Severe renal impairment (eGFR below 30 mL/minute/1.73 m²) (see *Warnings and Precautions* (5.1)).
 - Hypersensitivity to metformin.
 - Acute or chronic metabolic acidosis, including diabetic ketoacidosis, with or without coma.
- 5 WARNINGS AND PRECAUTIONS**
5.1 Lactic Acidosis
There have been postmarketing cases of metformin-associated lactic acidosis, including fatal cases. These cases had a subtle onset and were accompanied by nonspecific symptoms such as malaise, myalgias, abdominal pain, respiratory distress, or increased somnolence; however, hypotension and resistant bradyarrhythmias have occurred with severe acidosis. Metformin-associated lactic acidosis was characterized by elevated blood lactate concentrations (> 5mmol/L), anion gap acidosis (without evidence of ketonuria or ketonemia), and an increased lactate/pyruvate ratio; metformin plasma levels were generally > 5 mcg/mL. Metformin decreases liver uptake of lactate increasing lactate blood levels which may increase the risk of lactic acidosis, especially in patients at risk.
- If metformin associated lactic acidosis is suspected, general supportive measures should be instituted promptly in a hospital setting, along with immediate discontinuation of metformin hydrochloride. In metformin hydrochloride treated patients with a diagnosis or strong suspicion of lactic acidosis, prompt hemodialysis is recommended to correct the acidosis and remove accumulated metformin (metformin hydrochloride is dialyzable with a clearance of up to 170 mL/min under good hemodynamic conditions). Hemodialysis has often resulted in reversal of symptoms and recovery.
- Educate patients and their families about the symptoms of lactic acidosis and, if these symptoms occur, instruct them to discontinue metformin hydrochloride and report these symptoms to their healthcare provider.
- For each of the known and possible risk factors for metformin-associated lactic acidosis, recommendations to reduce the risk of and manage metformin-associated lactic acidosis are provided below:
- Renal impairment*—The postmarketing metformin-associated lactic acidosis cases primarily occurred in patients with significant renal impairment.
- The risk of metformin accumulation and metformin-associated lactic acidosis increases with the severity of renal impairment because metformin is substantially excreted by the kidney. Clinical recommendations based upon the patient's renal function include (see *Dosage and Administration* (2.3), *Clinical Pharmacology* (12.3)):
- Before initiating metformin hydrochloride, obtain an estimated glomerular filtration rate (eGFR).
 - Metformin hydrochloride is contraindicated in patients with an eGFR less than 30 mL/minute/1.73 m² (see *Contraindications* (4)).
 - Initiation of metformin hydrochloride is not recommended in patients with eGFR between 30 to 45 mL/minute/1.73 m².
 - Obtain an eGFR at least annually in all patients taking metformin hydrochloride. In patients at risk for the development of renal impairment (e.g., the elderly), renal function should be assessed more frequently.
 - In patients taking metformin hydrochloride whose eGFR falls below 45 mL/minute/1.73 m², assess the benefit and risk of continuing therapy.
- Drug interactions* — The concomitant use of metformin hydrochloride with specific drugs may increase the risk of metformin-associated lactic acidosis: those that impair renal function, result in significant hemodynamic change, interfere with acid-base balance, or increase metformin accumulation. Consider more frequent monitoring of patients (see *Drug Interactions* (7)).
- Age 65 or greater* — The risk of metformin-associated lactic acidosis increases with the patient's age because elderly patients have a greater likelihood of having hepatic, renal, or cardiac impairment than younger patients. Assess renal function more frequently in elderly patients.
- Radiologic studies with contrast* —Administration of intravascular iodinated contrast agents in metformin-treated patients has led to an acute decrease in renal function and the occurrence of lactic acidosis. Stop metformin hydrochloride at the time of, or prior to, an iodinated contrast imaging procedure in patients with an eGFR between 30 and 60 mL/minute/1.73 m²; in patients with a history of hepatic impairment, alcoholism or heart failure; or in patients who will be administered intra-arterial iodinated contrast. Re-evaluate eGFR 48 hours after the imaging procedure, and restart metformin hydrochloride if renal function is stable.

- restart metformin hydrochloride if renal function is stable.
- Surgery and other procedures* — Withholding of food and fluids during surgical or other procedures may increase the risk for volume depletion, hypotension, and renal impairment. Metformin hydrochloride should be temporarily discontinued while patients have restricted food and fluid intake.
 - Hypoxic states* — Several of the postmarketing cases of metformin-associated lactic acidosis occurred in the setting of acute congestive heart failure (particularly when accompanied by hypoperfusion and hypoxemia). Cardiovascular collapse (shock), acute myocardial infarction, sepsis, and other conditions associated with hypoxemia have been associated with lactic acidosis and may cause prerenal azotemia. When such an event occurs, discontinue metformin hydrochloride.
 - Excessive alcohol intake* — Alcohol potentiates the effect of metformin on lactate metabolism. Patients should be warned against excessive alcohol intake while receiving metformin hydrochloride.
 - Hepatic impairment* — Patients with hepatic impairment have developed cases of metformin-associated lactic acidosis. This may be due to impaired lactate clearance resulting in higher lactate blood levels. Therefore, avoid use of metformin hydrochloride in patients with clinical or laboratory evidence of hepatic disease.

5.2 Vitamin B₁₂ Deficiency
In clinical trials of 28-week duration with metformin hydrochloride (HCl) tablets, a decrease to subnormal levels of previously normal serum vitamin B₁₂ levels was observed in approximately 7% of patients. Such decrease, possibly due to interference with B₁₂ absorption from the B₁₂-intrinsic factor complex, may be associated with anemia but appears to be rapidly reversible with discontinuation of metformin or vitamin B₁₂ supplementation. Certain individuals (those with inadequate vitamin B₁₂ or calcium intake or absorption) appear to be predisposed to developing subnormal vitamin B₁₂ levels. Measure hematologic parameters on an annual basis and vitamin B₁₂ at 2 to 3 year intervals in patients on metformin hydrochloride and manage any abnormalities (see *Adverse Reactions* (6.1)).

5.3 Hypoglycemia with Concomitant Use with Insulin and Insulin Secretagogues
Insulin and insulin secretagogues (e.g., sulfonylureas) are known to cause hypoglycemia. Metformin hydrochloride may increase the risk of hypoglycemia when combined with insulin and/or an insulin secretagogue. Therefore, a lower dose of insulin or insulin secretagogue may be required to minimize the risk of hypoglycemia when used in combination with metformin hydrochloride (see *Drug Interactions* (7)).

5.4 Macrovascular Outcomes
There have been no clinical studies establishing conclusive evidence of macrovascular risk reduction with metformin hydrochloride.

- 6 ADVERSE REACTIONS**
The following adverse reactions are also discussed elsewhere in the labeling:
- Lactic Acidosis (see *Boxed Warning and Warnings and Precautions* (5.1))
 - Vitamin B₁₂ Deficiency (see *Warnings and Precautions* (5.2))
 - Hypoglycemia (see *Warnings and Precautions* (5.3))

6.1 Clinical Studies Experience
Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice.

In a U.S. clinical trial of metformin HCl tablets in patients with type 2 diabetes mellitus, a total of 141 patients received metformin HCl tablets up to 2,550 mg per day. Adverse reactions reported in greater than 5% of patients treated with metformin HCl tablets and that were more common than in placebo-treated patients, are listed in Table 1.

Table 1: Adverse Reactions from a Clinical Trial of Metformin HCl Tablets Occurring > 5% and More Common than Placebo in Patients with Type 2 Diabetes Mellitus

	Metformin HCl Tablets (n = 141)	Placebo (n = 145)
Diarrhea	53%	12%
Nausea/Vomiting	25%	8%
Flatulence	12%	6%
Asthenia	9%	6%
Indigestion	7%	4%
Abdominal Discomfort	6%	5%
Headache	6%	5%

Diarrhea led to discontinuation of metformin HCl tablets in 6% of patients. Additionally, the following adverse reactions were reported in ≥ 1% to ≤ 5% of patients treated with metformin HCl tablets and were more commonly reported than placebo: abnormal stools, hypoglycemia, myalgia, lightheaded, dyspnea, nail disorder, rash, sweating increased, taste disorder, chest discomfort, chills, flu syndrome, flushing, palpitation.

Pediatric Patients
In clinical trials with metformin HCl tablets in pediatric patients with type 2 diabetes mellitus, the profile of adverse reactions was similar to that observed in adults.

Laboratory Tests
Vitamin B₁₂ Concentrations
In clinical trials of 28-week duration with metformin HCl tablets, a decrease to subnormal levels of previously normal serum vitamin B₁₂ levels was observed in approximately 7% of patients.

6.2 Postmarketing Experience
The following adverse reactions have been identified during post approval use of metformin. Because these reactions are reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure.

Cholestatic, hepatocellular, and mixed hepatocellular liver injury have been reported with postmarketing use of metformin.

7 DRUG INTERACTIONS
Table 2 presents clinically significant drug interactions with metformin hydrochloride.

Table 2: Clinically Significant Drug Interactions with Metformin Hydrochloride	
Carbonic Anhydrase Inhibitors	
<i>Clinical Impact:</i>	Carbonic anhydrase inhibitors frequently cause a decrease in serum bicarbonate and induce non-anion gap, hyperchloremic metabolic acidosis. Concomitant use of these drugs with metformin hydrochloride may increase the risk for lactic acidosis.
<i>Intervention:</i>	Consider more frequent monitoring of these patients.
<i>Examples:</i>	Topiramate, zonisamide, acetazolamide or dichlorophenamide.
Drugs that Reduce Metformin Hydrochloride Clearance	
<i>Clinical Impact:</i>	Concomitant use of drugs that interfere with common renal tubular transport systems involved in the renal elimination of metformin (e.g., organic cationic transporter-2 (OCT1)) multidrug and toxin extrusion (MATE) inhibitors) could increase systemic exposure to metformin and may increase the risk for lactic acidosis (see <i>Clinical Pharmacology</i> (12.3)).
<i>Intervention:</i>	Consider the benefits and risks of concomitant use with metformin hydrochloride.
<i>Examples:</i>	Ranolazine, vandetanib, dolutegravir, and cimetidine.
Alcohol	
<i>Clinical Impact:</i>	Alcohol is known to potentiate the effect of metformin on lactate metabolism.
<i>Intervention:</i>	Warn patients against excessive alcohol intake while receiving metformin hydrochloride.
Insulin Secretagogues or Insulin	
<i>Clinical Impact:</i>	Concomitant use of metformin hydrochloride with an insulin secretagogue (e.g., sulfonylurea) or insulin may increase the risk of hypoglycemia.
<i>Intervention:</i>	Patients receiving an insulin secretagogue or insulin may require lower doses of the insulin secretagogue or insulin.
Drugs Affecting Glycemic Control	
<i>Clinical Impact:</i>	Certain drugs tend to produce hyperglycemia and may lead to loss of glycemic control.
<i>Intervention:</i>	When such drugs are administered to a patient receiving metformin hydrochloride, observe the patient closely for loss of blood glucose control. When such drugs are withdrawn from a patient receiving metformin hydrochloride, observe the patient closely for hypoglycemia.
<i>Examples:</i>	Thiazides and other diuretics, corticosteroids, phenothiazines, thyroid products, estrogens, oral contraceptives, phenytoin, nicotinic acid, sympathomimetics, calcium channel blockers, and zonisaid.

8 USE IN SPECIFIC POPULATIONS
8.1 Pregnancy
Risk Summary
Limited data with metformin hydrochloride in pregnant women are not sufficient to determine a drug-associated risk for major birth defects or miscarriage. Published studies with metformin use during pregnancy have not reported a clear association with metformin and major birth defect or miscarriage risk (see *Data*). There are risks to the mother and fetus associated with poorly controlled diabetes mellitus in pregnancy (see *Clinical Considerations*).

No adverse developmental effects were observed when metformin was administered to pregnant Sprague Dawley rats and rabbits during the period of organogenesis at doses up to 2- and 5- times, respectively, a 2,550 mg clinical dose, based on body surface area (see *Data*).

The estimated background risk of major birth defects is 6 to 10% in women with pre-gestational diabetes mellitus with an HbA1C > 7 and has been reported to be as high as 20 to 25% in women with a HbA1C > 10. The estimated background risk of miscarriage for the indicated population is unknown. In the U.S. general population, the estimated background risk of major birth defects and miscarriage in clinically recognized pregnancies is 2 to 4% and 15 to 20%, respectively.

PATIENT INFORMATION

Metformin Hydrochloride Oral Solution (met for' min hye'droe klor' ide)

What is the most important information I should know about metformin hydrochloride oral solution?

Metformin hydrochloride oral solution can cause serious side effects, including: Lactic Acidosis. Metformin hydrochloride, the medicine in metformin hydrochloride oral solution, can cause a rare, but serious side effect called lactic acidosis (a build-up of lactic acid in the blood) that can cause death. Lactic acidosis is a medical emergency and must be treated in a hospital.

Stop taking metformin hydrochloride oral solution and call your healthcare provider right away if you get any of the following symptoms of lactic acidosis:

- feel very weak and tired
- have unusual (not normal) muscle pain
- have trouble breathing
- have unexplained stomach or intestinal problems with nausea and vomiting, or diarrhea
- feel very weak and tired
- feel cold, especially in your arms and legs
- feel dizzy or lightheaded
- have a slow or irregular heartbeat

You have a higher chance of getting lactic acidosis if you:

- have moderate to severe kidney problems. See **“Do not take metformin hydrochloride oral solution if you”**
- have liver problems.
- have congestive heart failure that requires treatment with medicines.
- drink a lot of alcohol (very often or short-term “binge” drinking).
- get dehydrated (lose a large amount of body fluids). This can happen if you are sick with a fever, vomiting, or diarrhea. Dehydration can also happen when you sweat a lot with activity or exercise and do not drink enough fluids.
- have certain x-ray tests with injectable dyes or contrast agents.
- have surgery.
- have a heart attack, severe infection, or stroke.
- are 65 years of age or older.

Tell your healthcare provider if you have any of the problems in the list above.

Tell your healthcare provider that you are taking metformin hydrochloride oral solution before you have surgery or x-ray tests. Your healthcare provider may need to stop metformin hydrochloride oral solution for a while if you have surgery or certain x-ray tests. Metformin hydrochloride oral solution can have other serious side effects. See **“What are the possible side effects of metformin hydrochloride oral solution?”**

What is metformin hydrochloride oral solution?

- Metformin hydrochloride oral solution is a prescription medicine that contains metformin hydrochloride. Metformin hydrochloride oral solution is used with diet and exercise to help control high blood sugar (hyperglycemia) in adults and children 10 years of age and older with type 2 diabetes.
- It is not known if metformin hydrochloride oral solution is safe and effective in children under 10 years of age.

Do not take metformin hydrochloride oral solution if you:

- have severe kidney problems.
 - are allergic to the metformin hydrochloride or any of the ingredients in metformin hydrochloride oral solution. See the end of this Patient Information leaflet for a complete list of ingredients in metformin hydrochloride oral solution.
 - have a condition called metabolic acidosis including diabetic ketoacidosis (high levels of certain acids called “ketones” in your blood or urine).
- Before taking metformin hydrochloride oral solution tell your healthcare provider about all your medical conditions, including if you:**
- have a history or risk for diabetic ketoacidosis. See **“Do not take metformin hydrochloride oral solution if you?”**
 - have kidney problems.
 - have liver problems.
 - have heart problems, including congestive heart failure.
 - are 65 years or older.
 - drink alcohol very often or drink a lot of alcohol in short-term “binge” drinking.
 - are taking insulin or a sulfonylurea medicine.
 - are pregnant or plan to become pregnant. It is not known if metformin hydrochloride oral solution will harm your unborn baby. If you are pregnant, talk with your healthcare provider about the best way to control your blood sugar while you are pregnant.
 - are a premenopausal woman who does not have periods regularly or at all. Metformin hydrochloride oral solution can cause the release of an egg from an ovary in a woman (ovulation). This can increase your chance of getting pregnant.
 - are breastfeeding or plan to breastfeed. Metformin can pass into your breast milk. Talk with your healthcare provider about the best way to feed your baby while you take metformin hydrochloride oral solution.

Tell your healthcare provider about all the medicines you take, including prescription and over-the-counter medicines, vitamins, and herbal supplements. Know the medicines you take. Keep a list of them to show your healthcare provider and pharmacist when you get a new medicine.

Metformin hydrochloride oral solution may affect the way other medicines work, and other medicines may affect how metformin hydrochloride oral solution works.

How should I take metformin hydrochloride oral solution?

- Take metformin hydrochloride oral solution exactly as your healthcare provider tells you.
- Use the metformin hydrochloride oral solution dosing cup to measure your dose. Ask your pharmacist for a dosing cup if you do not have one.
- Metformin hydrochloride oral solution should be taken with meals to help decrease an upset stomach.
- When your body is under some types of stress, such as fever, trauma (such as a car accident), infection, or surgery, the amount of diabetes medicine that you need may change. Tell your healthcare provider right away if you have any of these problems.
- Your healthcare provider should do blood tests to check how well your kidneys are working before and during your treatment with metformin hydrochloride oral solution.
- Your healthcare provider will check your diabetes with regular blood tests, including your blood sugar levels and your hemoglobin A1C.
- Low blood sugar (hypoglycemia) can happen more often when metformin hydrochloride oral solution is taken with certain other diabetes medicines. Talk to your healthcare provider about how to prevent, recognize and manage low blood sugar. See “What are the possible side effects of metformin hydrochloride oral solution?”
- Check your blood sugar as your healthcare provider tells you to.
- Stay on your prescribed diet and exercise program while taking metformin hydrochloride oral solution.
- If you take too much metformin hydrochloride oral solution, call your healthcare provider, or go to the nearest hospital emergency room right away.

What should I avoid while taking metformin hydrochloride oral solution?

Do not drink a lot of alcoholic drinks while taking metformin hydrochloride oral solution. This means you should not binge drink for short periods, and you should not drink a lot of alcohol on a regular basis. Alcohol can increase the chance of getting lactic acidosis.

What are the possible side effects of metformin hydrochloride oral solution?

Metformin hydrochloride oral solution may cause serious side effects, including:

- See “What is the most important information I should know about metformin hydrochloride oral solution?”
- **Low vitamin B₁₂ (vitamin B₁₂ deficiency).** Using metformin hydrochloride oral solution may cause a decrease in the amount of vitamin B₁₂ in your blood, especially if you have had low vitamin B₁₂ levels before. Your healthcare provider may do blood tests to check your vitamin B₁₂ levels.
- **Low blood sugar (hypoglycemia).** If you take metformin hydrochloride oral solution with another medicine that can cause lower blood sugar, such as a sulfonylurea or insulin, your risk of getting low blood sugar is higher. The dose of your sulfonylurea medicine or insulin may need to be lowered while you take metformin hydrochloride oral solution. Signs and symptoms of low blood sugar may include:
 - headache
 - hunger
 - dizziness
 - drowsiness
 - fast heartbeat
 - sweating
 - weakness
 - confusion
 - irritability
 - shaking or feeling jittery

Common side effects of metformin hydrochloride oral solution include:

- diarrhea
- indigestion
- nausea and vomiting
- stomach-area (abdominal) discomfort
- gassiness (flatulence)
- headache
- weakness or lack of energy (asthenia)

These are not all the possible side effects of metformin hydrochloride oral solution.

Call your doctor for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.

How should I store metformin hydrochloride oral solution?

- Store at room temperature between 59°F to 86°F (15°C to 30°C). See insert.
- Keep metformin hydrochloride oral solution and all medicines out of the reach of children.

General information about the safe and effective use of metformin hydrochloride oral solution.

Medicines are sometimes prescribed for purposes other than those listed in a Patient Information leaflet. Do not use metformin hydrochloride oral solution for a condition for which it was not prescribed. Do not give metformin hydrochloride oral solution to other people, even if they have the same symptoms that you have. It may harm them.

You can ask your pharmacist or healthcare provider for information about metformin hydrochloride oral solution that is written for health professionals.

What are the ingredients of metformin hydrochloride oral solution?

Active ingredients: metformin hydrochloride.

Inactive ingredients: artificial cherry flavor, hydrochloric acid, potassium bicarbonate, purified water, sucralose, and xylitol.

Manufactured for:
Camber Pharmaceuticals, Inc.
Piscataway, NJ 08854

By: Annora Pharma Pvt. Ltd.
Sangareddy - 502313, Telangana, India.

For more information, call Annora Pharma Private Limited at 1-866-495-1995.

This Patient Information has approved by the U.S. Food and Drug Administration

Revised: 03/2025

Clinical Considerations

Disease-associated maternal and/or embryofetal risk

Poorly-controlled diabetes mellitus in pregnancy increases the maternal risk for diabetic ketoacidosis, pre-eclampsia, spontaneous abortions, preterm delivery, stillbirth and delivery complications. Poorly controlled diabetes mellitus increases the fetal risk for major birth defects, stillbirth, and macrosomia related morbidity.

Data

Human Data

Published data from post-marketing studies have not reported a clear association with metformin and major birth defects, miscarriage, or adverse maternal or fetal outcomes when metformin was used during pregnancy. However, these studies cannot definitely establish the absence of any metformin-associated risk because of methodological limitations, including small sample size and inconsistent comparator groups.

Animal Data

Metformin hydrochloride did not adversely affect development outcomes when administered to pregnant rats and rabbits at doses up to 600 mg/kg/day. This represents an exposure of about 2 and 5 times a 2,550 mg clinical dose based on body surface area comparisons for rats and rabbits, respectively. Determination of fetal concentrations demonstrated a partial placental barrier to metformin.

8.2 Lactation

Risk Summary

Limited published studies report that metformin is present in human milk (see Data). However, there is insufficient information to determine the effects of metformin on the breastfed infant and no available information on the effects of metformin on milk production. Therefore, the developmental and health benefits of breastfeeding should be considered along with the mother's clinical need for metformin hydrochloride and any potential adverse effects on the breastfed child from metformin hydrochloride or from the underlying maternal condition.

Data

Published clinical lactation studies report that metformin is present in human milk which resulted in infant doses approximately 0.11% to 1% of the maternal weight-adjusted dosage and a milk/plasma ratio ranging between 0.13 and 1. However, the studies were not designed to definitively establish the risk of use of metformin during lactation because of small sample size and limited adverse event data collected in infants.

8.3 Females and Males of Reproductive Potential

Discuss the potential for unintended pregnancy with premenopausal women as therapy with metformin hydrochloride may result in ovulation in some anovulatory women.

8.4 Pediatric Use

The safety and effectiveness of metformin hydrochloride for the treatment of type 2 diabetes mellitus have been established in pediatric patients 10 to 16 years old. Safety and effectiveness of metformin hydrochloride have not been established in pediatric patients less than 10 years old.

Use of metformin hydrochloride in pediatric patients 10 to 16 years old for the treatment of type 2 diabetes mellitus is supported by evidence from adequate and well-controlled studies of metformin HCl tablets in adults with additional data from a controlled clinical study of metformin HCl tablets in pediatric patients 10 to 16 years old with type 2 diabetes mellitus, which demonstrated a similar response in glycemic control to that seen in adults (see Clinical Studies (14)). In this study, adverse reactions were similar to those described in adults. A maximum daily dose of 2,000 mg of metformin hydrochloride is recommended. (See Dosage and Administration (2.2)).

8.5 Geriatric Use

Controlled clinical studies of metformin HCl tablets did not include sufficient numbers of elderly patients to determine whether they respond differently from younger patients. In general, dose selection for an elderly patient should be cautious, usually starting at the low end of the dosing range, reflecting the greater frequency of decreased hepatic, renal, or cardiac function, and of concomitant disease or other drug therapy and the higher risk of lactic acidosis. Assess renal function more frequently in elderly patients (see Warnings and Precautions (5.1)).

8.6 Renal Impairment

Metformin is substantially excreted by the kidney, and the risk of metformin accumulation and lactic acidosis increases with the degree of renal impairment. Metformin hydrochloride is contraindicated in severe renal impairment, patients with an estimated glomerular filtration rate (eGFR) below 30 mL/min(1.73 m²) (see Dosage and Administration (2.3), Contraindications (4), Warnings and Precautions (5.1), and Clinical Pharmacology (12.3)).

8.7 Hepatic Impairment

Use of metformin in patients with hepatic impairment has been associated with some cases of lactic acidosis. Metformin hydrochloride is not recommended in patients with hepatic impairment. (see Warnings and Precautions (5.1)).

10 OVERDOSAGE

Overdose of metformin hydrochloride has occurred, including ingestion of amounts greater than 50 grams. Hypoglycemia was reported in approximately 10% of cases, but no causal association with metformin has been established. Lactic acidosis has been reported in approximately 32% of metformin overdose cases (see Warnings and Precautions (5.1)). Metformin is dialyzable with a clearance of up to 170 mL/min under good hemodynamic conditions. Therefore, hemodialysis may be useful for removal of accumulated drug from patients in whom metformin overdose is suspected.

11 DESCRIPTION

Metformin hydrochloride oral solution contains the biguanidine antihyperglycemic agent metformin in the form of monohydrochloric salt. Metformin hydrochloride, is *N,N*-dimethylimidazolidinone dihydrochloride. The structural formula is shown as:

Metformin hydrochloride USP is a white crystalline powder with a molecular formula of C₄H₈N₄•HCl and a molecular weight of 165.62. Metformin hydrochloride, USP 2.0 is soluble in 20 mL of water. The pKa of metformin is 12.4. The pH of a 1% aqueous solution of metformin hydrochloride is 6.68. It is freely soluble in water; slightly soluble in alcohol, practically insoluble in acetone and in methylene chloride.

Metformin hydrochloride (Cherry Flavor) contains 500 mg of metformin hydrochloride USP (the equivalent of 389.93 mg metformin) per 5 mL and the following inactive ingredients: artificial cherry flavor, hydrochloric acid, potassium bicarbonate, purified water, sucralose, and xylitol.

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

Metformin is an antihyperglycemic agent which improves glucose tolerance in patients with type 2 diabetes mellitus, lowering both basal and postprandial plasma glucose. Metformin decreases hepatic glucose production, decreases intestinal absorption of glucose, and improves insulin sensitivity by increasing peripheral glucose uptake and utilization. With metformin therapy, insulin secretion remains unchanged while fasting insulin levels and day-long plasma insulin response may decrease.

12.3 Pharmacokinetics

Absorption

Two pharmacokinetic studies performed in healthy volunteers to evaluate the bioavailability of metformin hydrochloride in comparison with metformin HCl tablets under fasting and fed conditions showed that the rate and extent of absorption of metformin hydrochloride was found to be comparable to that of metformin HCl tablets under fasting or fed conditions (see Table 3).

Table 3: Select Mean (± S.D.) Pharmacokinetic Parameters Following Single Oral Doses of 1000 mg Metformin Hydrochloride and Metformin HCl tablets in healthy, nondiabetic adults (n = 36) under fed and fasting conditions				
Formulation	C _{max} (ng/mL)	AUC _{0-12h} (ng·h/mL)	T _{max} (h)	
Study 1: Fasting state				
Metformin Hydrochloride	1540.1 ± 451.1	9898.6 ± 2593.6	2.2 ± 0.5	
Metformin HCl Tablets	1865.1 ± 498.5	11100.1 ± 2733.1	2.5 ± 0.6	
T/R Ratio X 100 (90% confidence interval)	81.2 (76.3 to 86.4)	81.2 (76.8 to 85.6)	-	
Study 2: Fed State				
Metformin Hydrochloride	1235.3 ± 177.7	8950.1 ± 1381.2	4.1 ± 0.8	
Metformin HCl Tablets	1361 ± 298.8	9307.7 ± 1839.8	3.7 ± 0.8	
T/R Ratio X 100 (90% confidence interval)	81.8 (87.4 to 96.5)	97.0 (92.9 to 101.2)	-	

T: test product (Metformin hydrochloride)

R: reference product (Immediate release metformin HCl tablets)

Studies using single oral doses of metformin HCl tablets 500 mg to 1,500 mg, and 850 mg to 2,550 mg, indicate that there is a lack of dose proportionality with increasing doses, which is due to decreased absorption rather than an alteration in elimination. At usual clinical doses and dosing schedules of metformin, steady state plasma concentrations of metformin are reached within 24 to 48 hours and are generally < 1 mcg/mL.

Effect of food: The food-effect study assessed the effects of a high fat/high calorie meal and a low fat/low calorie meal on the bioavailability of metformin hydrochloride in comparison with administration in the fasted state, in healthy volunteers. The extent of absorption was increased by approximately 16% and 13% with the low fat/low calorie meal and the high fat/high calorie meal, respectively, compared with the administration in the fasted state. The rate and extent of absorption with high fat/high calorie and low fat/ low calorie meal were similar. The mean T_{max} was 2.5 hours under fasting conditions as compared to 3.9 hours with both low fat/ low calorie meal and high fat/high calorie meals (see Table 4).

Table 4: Select Mean (± S.D.) Metformin in Pharmacokinetic Parameters Following Single Oral Doses of 1,000 mg Metformin Hydrochloride in healthy, nondiabetic adults (n = 33) under fed (high fat/high calorie meal and low fat/low calorie meal) and fasting conditions (study 3)				
Meal type	C _{max} (ng/mL)	AUC _{0-12h} (ng·h/mL)	T _{max} (h)	
Fasting (F)	1641.5 ± 551.8	9982.9 ± 2544.5	2.5 ± 0.9	
Low fat/ low calorie meal (L)	1525.8 ± 386.7	11542.0 ± 2947.5	3.9 ± 0.6	
High fat/high calorie meal (H)	1432.5 ± 346.8	11184.5 ± 2446.1	3.9 ± 0.8	
L/F Ratio X 100 (90% confidence interval)	94.6 (84.0 to 106.5)	115.6 (103.6 to 128.9)	-	
H/F Ratio X 100 (90% confidence interval)	89.4 (79.4 to 100.6)	112.6 (100.9 to 125.6)	-	
L/H Ratio X 100 (90% confidence interval)	105.8 (94.0 to 119.2)	102.7 (82.0 to 114.6)	-	

Distribution

The apparent volume of distribution (V/F) of metformin following single oral doses of metformin HCl 850 mg averaged 654 ± 358 L. Metformin is negligibly bound to plasma proteins. Metformin partitions into erythrocytes, most likely as a function of time.

Metabolism

Intervasive single-dose studies in normal subjects demonstrate that metformin is excreted unchanged in the urine and does not undergo hepatic metabolism (no metabolites have been identified in humans) nor biliary excretion.

Elimination

Renal clearance (see Table 5) is approximately 3.5 times greater than creatinine clearance, which indicates that tubular secretion is the major route of metformin elimination. Following oral administration, approximately 90% of the absorbed drug is eliminated via the renal route within the first 24 hours, with a plasma elimination half-life of approximately 6.2 hours. In blood, the elimination half-life is approximately 17.6 hours, suggesting that the erythrocyte mass may be a compartment of distribution.

Specific Populations

Renal Impairment

In patients with decreased renal function the plasma and blood half-life of metformin is prolonged and the renal clearance is decreased (see Table 5) (See Dosage and Administration (2.3), Contraindications (4), Warnings and Precautions (5.1) and Use in Specific Populations (8.6)).

Hepatic Impairment

No pharmacokinetic studies of metformin have been conducted in patients with hepatic impairment (See Warnings and Precautions (5.1) and Use in Specific Populations (8.7)).

Geriatrics

Studies of drug control from pharmacokinetic studies of metformin HCl tablets in healthy elderly subjects suggest that total plasma clearance of metformin is decreased, the half-life is prolonged, and C_{max} is increased, compared to healthy young subjects. It appears that the change in metformin pharmacokinetics with aging is primarily accounted for by a change in renal function (see Table 5). (See Warnings and Precautions (5.1) and Use in Specific Populations (8.5)).

Table 5: Select Mean (± S.D.) Metformin Pharmacokinetic Parameters Following Single or Multiple Oral Doses of Metformin HCl Tablets

Subject Groups: Metformin HCl dose* (number of subjects)	C _{max} [†] (mcg/mL)	T _{max} [†] (hrs)	Renal Clearance (mL/min)
Healthy, nondiabetic adults:			
500 mg single dose (24)	1.03 (± 0.33)	2.75 (± 0.81)	600 (± 132)
850 mg single dose (74) [‡]	1.60 (± 0.38)	2.64 (± 0.82)	552 (± 138)
850 mg three times daily for 19 doses* (9)	2.01 (± 0.42)	1.78 (± 0.94)	642 (± 173)
Adults with type 2 diabetes mellitus:			
850 mg single dose (23)	1.48 (± 0.5)	3.32 (± 1.08)	491 (± 138)
850 mg three times daily for 19 doses* (9)	1.90 (± 0.62)	2.01 (± 1.22)	550 (± 160)
Elderly[§], healthy nondiabetic adults:			
850 mg single dose (12)	2.45 (± 0.70)	2.71 (± 1.05)	412 (± 98)
Renal-impaired adults:			
850 mg single dose (24)	1.86 (± 0.52)	3.20 (± 0.45)	394 (± 122)
Mild (CL _{cr} ≥ 61 to 90 mL/min) (5)	4.12 (± 1.83)	3.75 (± 0.50)	108 (± 57)
Moderate (CL _{cr} 31 to 60 mL/min) (4)	3.93 (± 0.92)	4.01 (± 1.10)	130 (± 90)
Severe (CL _{cr} 10 to 30 mL/min) (6)			

* All doses given fasting except the first 18 doses of the multiple dose studies

[†] Peak plasma concentration

[‡] Time to peak plasma concentration

[§] Combined results (average mean) of five studies: mean age 32 years (range 23 to 59 years)

[¶] Kinetic study done following dose 19, given fasting

[‡] Elderly subjects, mean age 71 years (range 65 to 81 years)

[§] CL_{cr} = creatinine clearance normalized to body surface area of 1.73 m²

Pediatrics

After administration of a single oral metformin HCl 500 mg tablet with food, geometric mean metformin C_{max} and AUC differed less than 5% between pediatric type 2 diabetic patients (12 to 16 years of age) and gender- and weight-matched healthy adults (20 to 45 years of age), all with normal renal function.

Gender

Metformin pharmacokinetic parameters did not differ significantly between normal subjects and patients with type 2 diabetes mellitus when analyzed according to gender (males = 19, females = 16).

Race

No studies of metformin pharmacokinetic parameters according to race have been performed.

Drug Interactions

In Vivo Assessment of Drug Interactions

Table 6: Effect of Coadministered Drug on Plasma Metformin Systemic Exposure

Coadministered Drug	Dose of Coadministered Drug [†]	Dose of Metformin HCl [†]	Geometric Mean Ratio (ratio with/without coadministered drug) No Effect = 1.00	
			AUC [‡]	C _{max}
No dosing adjustments required for the following:				
Glyburide	5 mg	850 mg	metformin 0.91 [†]	0.93 [†]
Furosemide	40 mg	850 mg	metformin 1.09 [†]	1.22 [†]
Nifedipine	10 mg	850 mg	metformin 1.16	1.21
Propranolol	40 mg	850 mg	metformin 0.90	0.94
Ibuprofen	400 mg	850 mg	metformin 1.05 [†]	1.07 [†]
Cationic drugs eliminated by renal tubular secretion may reduce metformin elimination (See Warnings and Precautions (5.1) and Drug Interactions (2)).				
Cimetidine	400 mg	850 mg	metformin 1.40	1.61
Carbonic anhydrase inhibitors may cause metabolic acidosis (See Warnings and Precautions (5.1) and Drug Interactions (2)).				
Topiramate	100 mg [‡]	500 mg [‡]	metformin 1.25 [†]	1.17

All metformin HCl and coadministered drugs were given as single doses

AUC = AUC (INF)

[†] Ratio of arithmetic means

[‡] At steady state with topiramate 100 mg every 12 hours and metformin 500 mg every 12 hours; AUC = AUC_{0-12h}

Table 7: Effect of Metformin on Coadministered Drug Systemic Exposure

Coadministered Drug	Dose of Coadministered Drug*	Dose of Metformin HCl†	Geometric Mean Ratio (ratio with/without metformin) No Effect = 1.00	
			AUC‡	C _{max}
No dosing adjustments required for the following:				
Glyburide	5 mg	850 mg	glyburide 0.78†	0.63†
Furosemide	40 mg	850 mg	furosemide 0.87†	0.69†
Nifedipine	10 mg	850 mg	nifedipine 1.10†	1.08
Propranolol	40 mg	850 mg	propranolol 1.01†	1.02
Ibuprofen	400 mg	850 mg	ibuprofen 0.97†	1.01†
Cimetidine	400 mg	850 mg	cimetidine 0.95†	1.01

All metformin HCl and coadministered drugs were given as single doses

[†] AUC = AUC_{0-12h} unless otherwise noted

[†] Ratio of arithmetic means, p-value of difference < 0.05

[‡] AUC_{0-12h}, hr reported

[§] Ratio of arithmetic means

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

Long-term carcinogenicity studies have been performed in rats (dosing duration of 104 weeks) and mice (dosing duration of 91 weeks) at doses up to and including 900 mg/kg/day and 1,500 mg/kg/day, respectively. These doses are both approximately 3 times the maximum recommended human daily dose of 2,550 mg based on body surface area comparisons. No evidence of carcinogenicity with metformin was found in either male or female mice. Similarly, there was no tumorigenic potential observed with metformin in male rats. There was, however, an increased incidence of benign stromal uterine polyps in female rats treated with 900 mg/kg/day.

There was no evidence of a mutagenic potential of metformin in the following *in vitro* tests: Ames test (*S. typhimurium*), gene mutation test (mouse lymphoma cells), or chromosomal aberrations test (human lymphocytes). Results in the *in vivo* mouse micronucleus test were also negative.

Fertility of male or female rats was unaffected by metformin when administered at doses as high as 600 mg/kg/day, which is approximately 2 times the maximum recommended human daily dose of 2,550 mg based on body surface area comparisons.

14 CLINICAL STUDIES

Adult Clinical Studies

A double-blind, placebo-controlled, multicenter US clinical trial involving obese patients with type 2 diabetes mellitus whose hypergly
